Hello Dennis,

I'm not sure why my last email only showed a line of dasher on your side. Please see the message below again.

For your domain www.powerfleet.com, the proxy in use is the "Default Proxy Template", and these are its timeouts:

- Proxy connect timeout: 15 seconds, to establish the connection with the origin.

-Proxy send timeout: 30 seconds, between writes when sending the request to the origin.

-Proxy read timeout: 60 seconds, between reads when receiving the response from the origin.

-Keepalive timeout: 60 seconds.

-Send timeout: 10 seconds, between writes when sending the response to the client.

None of these is set to 23-24 seconds, so the failures at around 24.347 seconds for request ID 2ef3e7fd871e26c242b4b8f95b4ba5a6 don't come from a timeout configured on our side.

If you have access to the event log in the console, you can export the event in a JSON file. Search for the request using the request id, then click the Download Table Data button (the green download icon shown above), I've attached a screenshot for your reference. This will export the event as a JSON file, including upstream information such as the server address, response status, and response time.

Best regards,

Karen Mello

Hostinger needs the underlying connection/error details to continue its investigation.
For request `2ef3e7fd871e26c242b4b8f95b4ba5a6`, on **10 November 2026 around 08:55:59–08:56:23 UTC**, please provide:

1. The raw proxy error-log entry, identifying any connect/read timeout, TLS failure, reset or premature connection closure.
2. Whether your proxy **received an actual HTTP 504 from its upstream** or generated the 504 itself.
3. Upstream connection, TLS handshake, response-header and total response timings, where available.
4. The destination IP/port, Host header, TLS SNI and any intermediate proxy/load-balancer involved.

The dashboard records upstream `92.112.186.38:443` and origin time **24.347 seconds**. Hostinger has not found a matching completed access entry and needs these details to correlate its infrastructure logs.
Please preserve the logs and keep configuration unchanged. If this requires engineering escalation, please arrange it.
Kind regards,
Dennis

Dennis Ferreira

Hello Dennis,

Additionally, If you have access to the Events Log in your console, you can export the full event. Open the request ID, then use "Download" or "Copy Request as JSON". The export includes the upstream fields (address, status and response time).

Hi there, can you guys respond to this ASAP?

Thanks for sharing these details. I've noted the three failed POST requests, their 502/504 responses, the 23–25 second durations, and the fact that other article previews can still work.
The raw Link11 upstream logs are still needed to establish whether the responses came from the Hostinger origin or were generated by Link11. That information will give us the full picture needed to continue the infrastructure review.
I'll keep the current settings unchanged and share the Hostinger review reference as soon as it becomes available.

THANKS,
D

Hi there, thanks for this…
For request `2ef3e7fd871e26c242b4b8f95b4ba5a6`, the dashboard shows upstream `92.112.186.38:443`, status **504**, and origin time **24.347 seconds**.
Please confirm whether your proxy **received an HTTP 504 from the origin**, or generated it after an upstream timeout. Hostinger found no matching completed POST in its access logs.
Could you provide the matching raw proxy error and upstream connection/response timings to identify where the failure occurred?
Kind regards,
Dennis

On Nov 10, 2026 at 5:04 PM, Karen Mello wrote:

Hello Denis,

We have checked from our side and all the requests getting 502 and 504 are being blocked by origin side and no by WAAP side. All the timeouts in the events we checked happen after 23-24 seconds by origin time.

We have no timeout configured on our side for that duration. So we suggest checking the origin for the cause.

We have attached a screenshot for the origin timeout.

The content filter for powerfleet.com domain are in monitor mode. So the Content Filter does not block the request. It only adds the rule tag to them.

Request ids:

2ef3e7fd871e26c242b4b8f95b4ba5a6

Thanks for the access.

I inspected the matching event in the dashboard. It records `sent-to-origin`, `action:monitor`, `status:504`, `upstream-status:504`, and `exceeded-cf-inspection-size-limit`.
The POST contains 56,526 bytes of YOOtheme layout data for article 3980.
Please confirm:

1. Whether the inspection-size limit only limits inspection or affects forwarding/processing.
2. Whether the complete POST body was forwarded unchanged.
3. Whether “Block Events By Reblaze” was monitor-only for this event.

4. The underlying proxy error: read timeout, TLS/connect failure, reset, or an actual HTTP 504 received from Hostinger.

> Event: **10 November 2026, approximately 08:55:59 console time**, response timestamp **08:56:23 UTC**, source IP `156.155.19.37`, trace `ffm7-lb2`, host `www.powerfleet.com`.

Please provide the matching request ID and effective timeout values before proposing changes.
Thanks,
Dennis

On Nov 10, 2026 at 2:18 PM, Dennis Ferreira wrote:

Please confirm:

1. Did Hostinger actually return an HTTP 502/504 response, or did your proxy generate that status after an upstream failure?
2. What do the matching proxy error logs report: read timeout, connection/TLS failure, connection reset, or premature upstream closure?
3. What effective timeout values apply across the components handling these requests?

4. Are the displayed content-filter matches monitor-only, and what does the “Blocked by…” label mean for these events?

Thanks

Dennis Ferreira

On Nov 10, 2026 at 1:54 PM, Dennis Ferreira wrote:

Hi again,

I don’t currently have access to https://pointerusl11.app.reblaze.io/login. I requested a password reset using my email address, but nothing has arrived, including in my spam, junk or trash folders. Please confirm whether an account exists for my email address and arrange access to the relevant Events Log, or resend the invitation. In the meantime, please send the screenshots directly so the investigation can continue without waiting for console access.

This is affecting multiple users’ ability to work. Joomla builder previews are not updating, and recurring 502/504 errors interrupt editing. One colleague reports that tasks normally taking 10 minutes now take almost an hour because of repeated saves, retries and checks on the live site. Since the move to Link11/Reblaze, troubleshooting access and editing disruptions has consumed substantial time. While the root cause still needs confirmation, we need active investigation and a clear route to resolution.

Please provide concise answers covering:

- The recorded error reasons and upstream timings for the identified 502/504 requests.
- Any action required from Hostinger or our team.
- A safe temporary workaround for affected editors.
- Who is coordinating the investigation and when we can expect the next update.

Please treat this as an urgent operational issue, rather than only a console-access request.

Thank you,

Dennis

Hello Dennis,

Thank you for the timing and header captures; they let us find the exact request in our logs.

Attached are screenshots of the matching log entry request (POST to /us/component/content/article/on-site-4/?catid=229, 08:56:23 UTC on 10 November). They show the request details, including the request ID, the upstream timings and the reason recorded for the 504. Added also one 502 request in the shared ones.

pointerusl11 | Events Log

ip="156.155.19.37",method="POST",url~"/component/content/article/on-site-4", timestamp between 2026-11-09 12:56:47 and 2026-11-10 12:56:47

Here is the filter to pinpoint the search in the Events log section in the console.

We have not changed anything on our side.

If you have any other questions, please let us know.

Best regards,

Dragos Hodorogea
